

### ***Spoollex commitment to provide constant support to our customers***

*Technical rollers for face masks machine, ultrasonic welding stations or slitter-rewinders for textiles and spooling lines for meltblown, Spoollex and its 3 brands Calemard, Decoup+ and Roll Concept, are engaged in the fight against Covid-19 spread.*

Worldwide, our customers have to face with an increasing demand of health products, especially of disposable face masks. To support them despite the evolution of Covid-19 in France, Spoollex has adapted its organization to protect all the employees whilst maintaining support to the customers. During this critical period Roll Concept continues to manufacture and to deliver its technical rollers to major face mask machine manufacturers. With production capacities up to 600 masks/min, machines need high technical rollers with very low inertia in rotation. Thanks to its patented Alveotube profile in stock in our workshop, Roll Concept is able to react quickly to provide tailored made and easy to install low inertia rolls. On the other hand, Decoup+ has successfully adapted a manual sealing machine to produce face masks! Because it performs clean and resistant seams, ultrasounds are mainly used for quick manufacturing face mask operations. Our Decoup+ ultrasonic welding station is an independent and ergonomic working station, easy to use, affordable and perfectly adapted to small and medium size series. Then, despite the containment period, Calemard has provided the needed resources to support specific requests either for spooling machine or for wide slitter and was even able to deliver machines to cover urgent need for wide slitting textiles, non-woven and of course meltblown. In addition, continuing to ensure spare parts deliveries and remote technical assistance, SPOOLEX has specially answered to two specific requests for wide slitting machines. In compliance with safety regulation, a team of skilled technicians has first adapted one Orion T 2400 slitter-rewinder used in our showroom, to send it to the company SN Tissages Carret (provider of woven solutions) and help them fulfilling the increasing demand they are facing. This machine fitted with hot sealing technology is allowing sealing the heavy fabrics that are used to manufacture textile reusable/washable facial masks that Tissages Carret is manufacturing and distributing. Then, another Orion T2400 was urgently refurbished, within a week and delivered to the company Irema in Ireland. Irema is involved in the production of high-quality filter media since 1986 and produce disposable surgical face masks and face mask media. More than even, Spoollex is committed to assist and support its customers involved in the struggle against the virus.

Together and stronger in the fight against Covid-19.
